MADE FOR THE EXTREME!

FULL RANGE OF AUTOMATIC VALVE SOLUTIONS, ONE-STOP PROVISION OF VARIOUS TYPES OF

REGULATING CONTROL AND SHUT-OFF VALVES

VISIT WWW.CNCONTROL.CN TO LEARN MORE ABOUT US.

A large industrial ball valve is shown from a side-on perspective. The valve body is a polished metal, likely stainless steel, with a prominent circular seating area. It features a handle at the top and two horizontal mounting flanges with hexagonal nuts. The background is plain white.

Control Valve(Zhejiang) Co.,ltd

BALL VALVE

CONTROL BALL VALVE

Control Valve(Zhejiang) Co.,ltd with thirty years of experience in manufacturing control ball valves, designs ball valves based on customer requirements.

In order to meet the requirements of various engineering conditions and media, various structural designs are adopted.

At the same time, we have constantly absorbed the advanced technologies at home and abroad and developed unique pneumatic, electric and hydraulic valves.

The products are widely used in petroleum, chemical industry, natural gas, metal smelting, electric power, paper making and other industries.

WE SUPPLY CONTROL BALL VALVE BODY IN RANGE OF

Body Size: 1/ 2"~24"
DN15~DN600

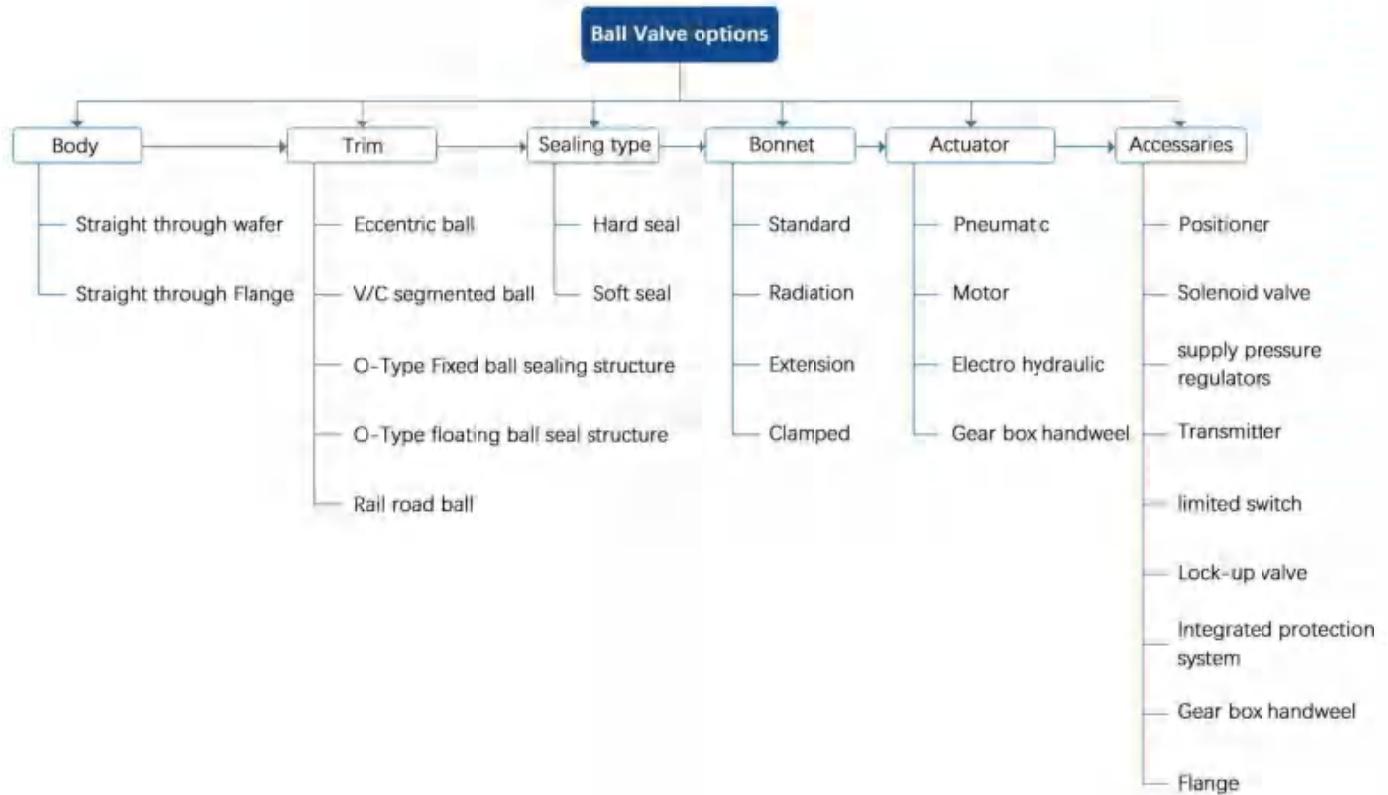

Pressure rating: ANSI CLASS150~900LB
PN1.0~PN16.0MPa

Temperature: -196~538°C

(Detail range refer to valve body type data)

BALL CONTROL VALVE BODIES:

- GYR-51100 Eccentric ball valve
- GYR-51200 V/C segmented ball valve
- GYR-51300 O-Type ball valve
- GYR-51400 Rail road ball valve

Note:

The above list is a guide diagram for the configuration of control ball valves. You can select the most appropriate control valve structure according to the arrow to meet the requirements of process parameters.

This document in the above configuration guidance diagram only involves some important contents.

Please check the relevant content you pay attention to according to the page P.

For electric actuators, electro-hydraulic actuators and relevant accessories not detailed in this document, please consult Control valve(Zhejiang) Co.,ltd's engineer for specific parameters.

This document does not list more detailed control valve performance parameters such as the maximum differential pressure allowed when the ball valve is equipped with an actuator, and the CV value corresponding to the corresponding opening of the valve. If you need to know, please consult the engineer or calculate the process parameters according to the selection software, and select the most appropriate control valve.

VALVE BODY TYPE

- Ball valve control valves involve different installation methods from process pipes. Control Valve(Zhejiang) Co.,ltd adopts the following two types of valve bodies as options:

Straight flange type (maximum specification: DN600)

Straight wafer type (maximum specification: DN400)

The structural length standard of straight through ball valve body is ASME B.16.10-2009
GB/T 12221-2005

PLUG SEALING STRUCTURE

- ▶ Control Valve(Zhejiang) Co.,ltd offer two kinds of plug seal packing
1. Patented self-sealing packing system for standard application.
2. Sulfur free Graphite V-Ring Packing system for high temperature application.
- ▶ self-sealing packing system is Control Valve(Zhejiang) Co.,ltd patented packing solution, 100 thousand full travel experiment ensure leak-free operation, long service life of precision control without friction increase.
- ▶ Graphite Packing is suitable for high temperature service, high thermal conductivity. Impervious to most hard to handle fluids, Meanwhile sulfur free material use spring compensation to prolong life cycle and maintenance free.

- ▶ Standard packing temperature and Pressure rating
Max. pressure : Class600/10.0 MPA
Max. temperature: -196°C~+250°C
- ▶ High temperature Packing temperature and Pressure rating
Max. pressure : Class600/10.0 MPA
Max. temperature: -196°C~+1100°C

- ▶ Packing material

PACKING	MATERIAL
Standard	PTFE/R.TFE/PPL

R51100**SPECIFICATION**

- ▶ Body size:1" – 16" DN25-DN300
- ▶ Pressure Rating:ANSI150LB-300LB PN1.0- 6.4Mpa
- ▶ Connection End: Flanged Wafer

APPLICATION

- ▶ Mining& petrochemical
- ▶ Chemical & Air seperation
- ▶ Water, heat supply system
- ▶ Pulp and paper, power plant

**PRODUCT FEATURES**

R51100 series eccentric segmental ball valve provide simple fluid path which brings small resistance, valve body is compact and light, wide range ability and accuracy. Eccentric segmental ball structure minimizes contact with the seat ring when opening, reducing seat wear and friction, prolonging seat life, and improving throttling performance. This style of rotary control valve suits erosive, slurry working condition. Rugged metal trim and big output torque ensure dependable working in rated pressure drop.

PLUG SEAL PACKING

- ▶ Self-sealing packing system
- ▶ Graphite Packing system

DATA

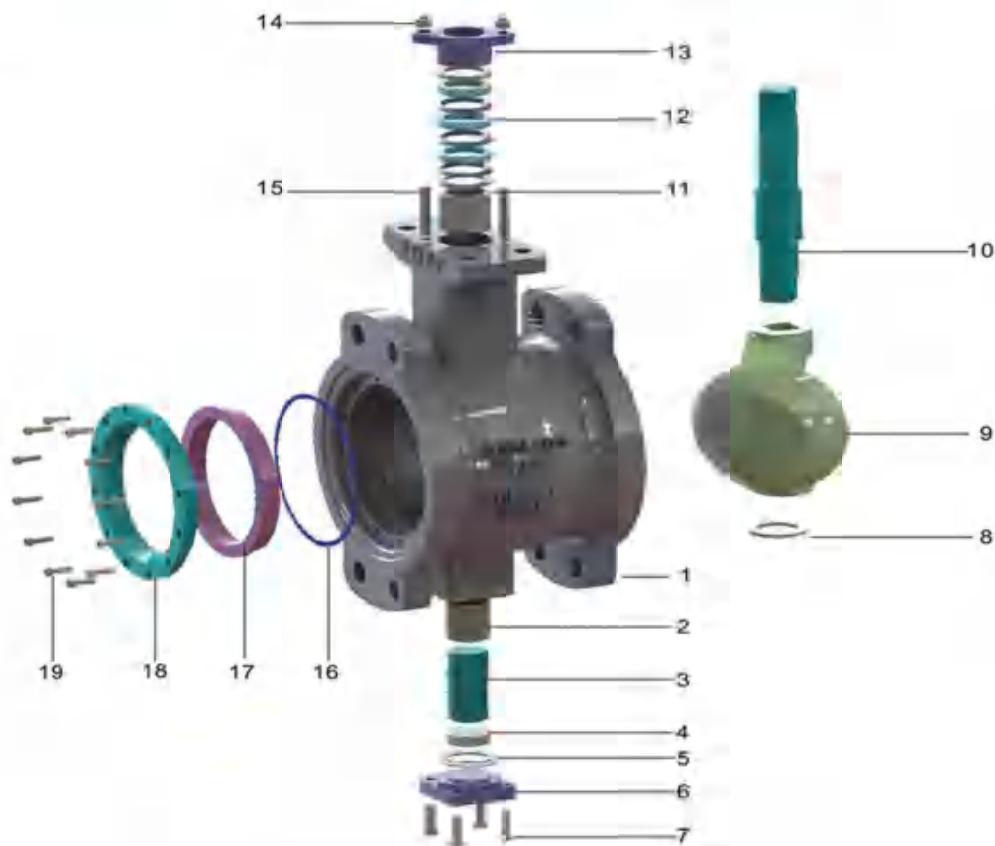

- ▶ Temperature rating -196-+538°C
- ▶ Leakage: ANSI B16.104 CLASS V
- ▶ Flow Characteristics: Approximate Linear
- ▶ Rangeability: 100:1
- ▶ Flange connection standard: JB/T 79.1-94~JB/T 79.4-94/HG20616-97

VALVE SEAT DESIGN

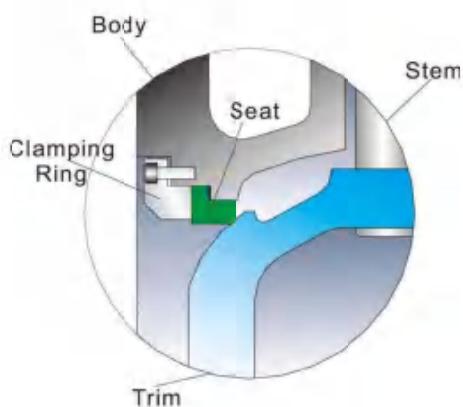

- Adopt Flexible fluorine O-ring as elastic ring, it is compressed with preload force to push valve seat maintain contact with trim to ensure sealing stability. Seat made of high temperature, corrosive resistance PTFE material, applicable to - 10°C ~ + 180°C orrosive medium.

- In even more strict require for leakage class, available with metal material as elastic ring, safely, stable sealing in frequent rotation. Applicable to -196°C ~ +250°C highleakage Class required service.

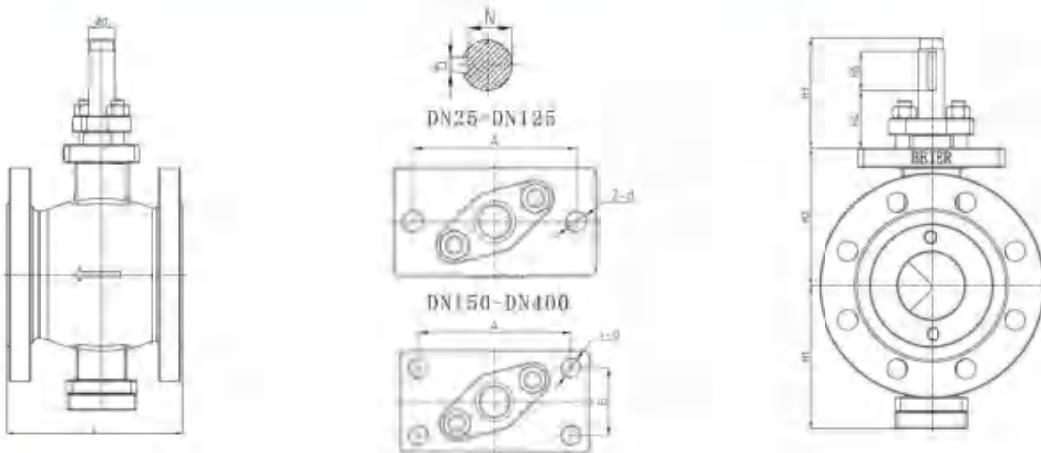

- In some industry process condition that medium mix with dirt may cause deposits and jam. In that cause metal-to-metal sealing provide abrasive resistance Co Cr alloy as seal seat surfacing, effectively prevent from particle damage, applicable to temperature rating:- 196°C ~ + 400°C and high pressure service.

R51200**PRODUCT MANUFACTURING SPECIFICATION**

- ▶ Caliber range: 1"- 24" DN25-DN600
- ▶ Pressure range: ANSI150-900 # PN10-160
- ▶ Connection type: flange type wafer type

**PRODUCT FEATURES**

R-51200 Series Segmented Ball valves features V/C type ball in valve trim , work wit positioner to modulating the fluids. Spring Load seat remains the ball in contact with seal during rotation, which produces a shearing effect as the ball closes and minimizes clogging.

The V ball produces an equal-percentage flow characteristic , it has good range-ability, control and shutoff capability, also the self clean function make it suited to control erosive , viscous, and slurries containing entrained solids or fibers.

V-type/C-type ball valve has the following characteristics:

- ▶ The spring loaded movable valve seat structure is adopted to prevent the valve core from sticking or separating from the valve seat. The seal is reliable and has a long service life.
- ▶ There is a shearing effect between the valve core and the metal valve seat of the V-notch, which is especially suitable for media containing fibers, small solid particles, slurry, etc.
- ▶ When the valve is fully opened, the flow capacity is large, the pressure loss is small, and the medium will not deposit in the valve body cavity.
- ▶ The valve has accurate regulation and reliable positioning function, approximate percentage of flow characteristics, and wide adjustable range. Maximum adjustable ratio: 200:1

PRODUCT APPLICATION

- ▶ Petroleum Smelting and Chemical Plant
- ▶ Metal smelting and pharmaceutical plants
- ▶ Environmental protection and power plant
- ▶ Mechanical paper making and power plant
- ▶ In water supply and heating system

VALVE STEM SEALING FORM

- ▶ Self sealing packing structure
- ▶ Flexible graphite packing structure

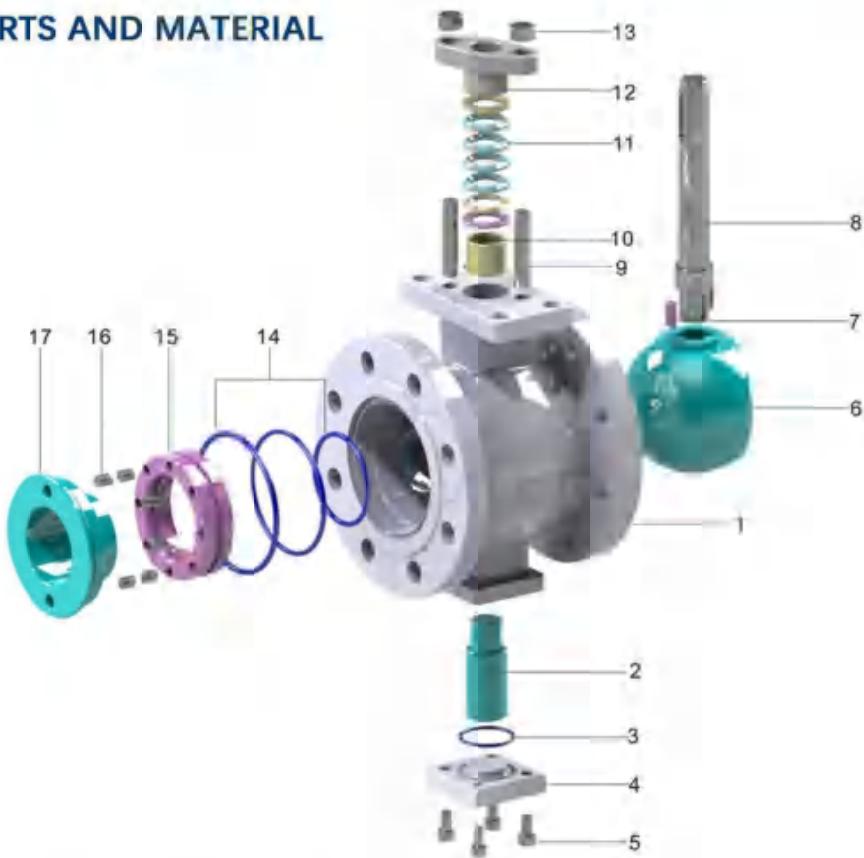

PARAMETER DESCRIPTION

- ▶ Temperature range - 196-538 °C
- ▶ Leakage class ANSI B16.104 CLASS V
- ▶ The flow characteristics are approximately equal to 100
- ▶ Connecting flange standard: JB/T 79.1-94~JB/T 79.4-94/HG20616-97

VARIOUS SEAT DESIGNS

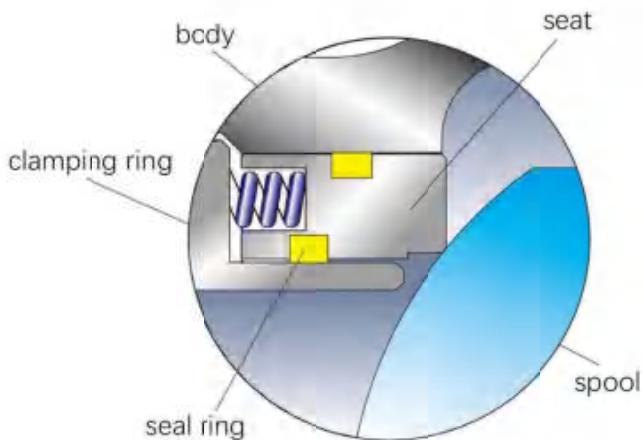

- The valve seat is made of non-metallic materials to enhance PTFE, which enhances the sealing performance and corrosion resistance of the valve seat. The outer ring of the valve seat is covered with metal material, and a spring is set at the end of the metal valve seat to ensure sufficient preload of the sealing ring. When the sealing surface of the valve is worn during use, the valve will continue to ensure good sealing performance under the action of the spring.

- The valve seat adopts an excellent fireproof structure: in order to prevent the polytetrafluoroethylene seal ring from burning out due to sudden heat or fire, causing large leakage and fueling the fire, a fireproof seal ring is set between the ball and the valve seat. When the seal ring is burned out, under the effect of spring force, the valve seat seal ring is quickly pushed onto the ball to form a metal to metal seal, which plays a certain sealing effect. The fire resistance test meets the standard requirements.

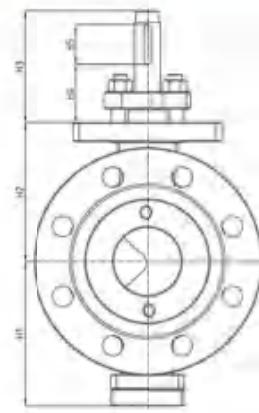

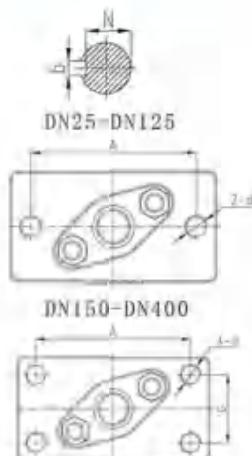

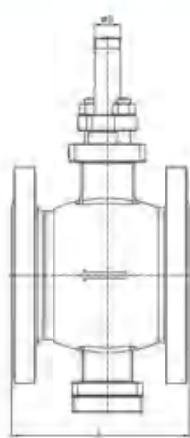

- The valve core and valve seat are made of metal materials and sealed with cobalt chromium hard alloy, greatly improving the wear resistance of the sealing surface. At the same time, the valve seat structure loaded with spring or leaf spring is adopted. Because the elastic restoring force of spring/leaf spring drives the valve seat, it can make the ball core and valve seat have good sealing performance for a long time. At the same time, since the valve seat adopts a spring loaded movable structure, the valve seat can be automatically calibrated to match the ball core.

R51300

PRODUCT MANUFACTURING SPECIFICATION

Diameter range: 1"~24" DN25-DN600
Pressure range: ANSI 150-900 # PN10-160
Connection type: flanged wafer threaded
Butt welding type

PRODUCT FEATURES

R-51300 series O-type ball valve is a kind of guidance transformation shut-off valve, which is also used as a regulating valve in a few occasions. It is used together with pneumatic actuator or electric actuator to achieve remote control, or it can be equipped with a handle or turbine to achieve manual control. This type of valve is mainly used to cut off, distribute and change the flow direction of media in the pipeline, which is a new type of valve widely used in recent years.

PRODUCT APPLICATION

- ▶ Petroleum Smelting and Chemical Plant
- ▶ Metal smelting and pharmaceutical plants
- ▶ Environmental protection and power plant
- ▶ Mechanical paper making and power plant
- ▶ In water supply and heating system

PARAMETER DESCRIPTION:

Valve stem sealing form: self sealing packing structure, sulfur free flexible graphite packing structure.
Flow characteristics: quick opening characteristics.
Valve body type: straight through, three-way.
Standard leakage class: ANSI B16.104-197 CLASS VI
applicable temperature: - 196~538 °C
Applicable medium: water, heavy oil, gas and some corrosive liquids

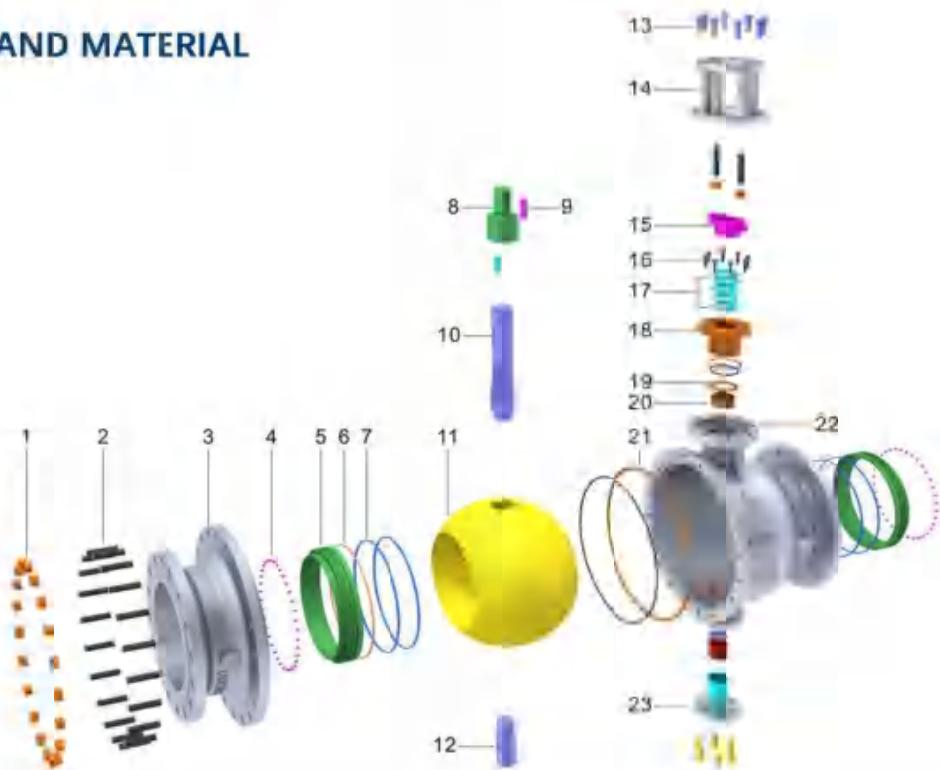

ADVANTAGE:

- ▶ The fluid resistance is small, and its resistance coefficient is equal to that of pipe sections with the same length
- ▶ Simple structure, small volume and light weight.
- ▶ It is tight and reliable. At present, the sealing surface material of the ball valve is widely made of plastic, with good sealing performance. It has also been widely used in the vacuum system.
- ▶ It is easy to operate and can be opened and closed quickly. Only 90° rotation is required from full opening to full closing, which is convenient for remote control.
- ▶ It is easy to maintain, the ball valve is simple in structure, the sealing ring is generally movable, and it is convenient to remove and replace.
- ▶ When the valve is fully opened or closed, the sealing surfaces of the ball and valve seat are isolated from the medium. When the medium passes through, it will not cause erosion of the valve sealing surface.
- ▶ It has a wide range of applications, ranging from a few millimeters to several meters in diameter from high vacuum to high pressure.

DESIGN FEATURES OF FIXED BALL VALVE

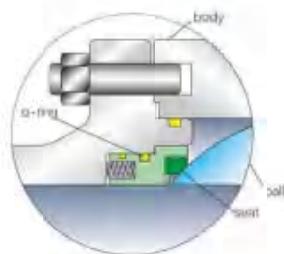

DESIGN FEATURES OF FIXED BALL VALVE

- Trunnion ball valve seat design with an auxiliary emergency sealing system, once the soft seal damaged or emergency situations occur can not sealed, the secondary seal system by injecting appropriate emergency sealant to seal. Emergency greasing device can also be used when necessary to flush the lubrication of the seal area to keep it clean

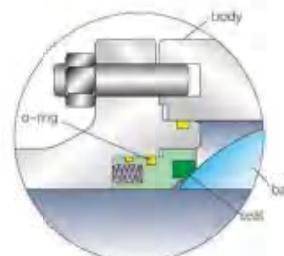

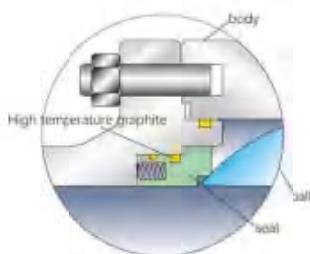

VARIOUS SEAT DESIGNS

- Elastic front seat seal design structure, which has a double seal and automatic pressure relief function in the cavity. Inlaid with suitable polymeric materials (polymer material NYLON, MOLON.DELRIN or PEEK). Seal seat is floating spring loaded. In the closed position, the sealing surface has always maintained close contact with the ball, make sure the valve leakage free in the high or low pressure differential.
- Front seat with seal design: import side, the seat due to the formation of a differential area piston effect in the medium under pressure before and after the effect of the seat, plus spring preload the front seat with the ball in close contact with the ball and seal. The outlet side of the valve seat ring and ball, also produce piston effect under medium pressure valve body cavity effect, so that the ball in close contact with the valve seat ring and seal

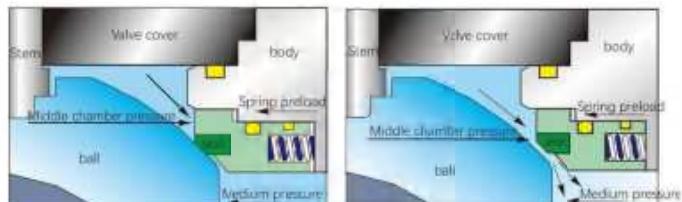

- Seat fire resistance design: according to the conditions and needs of users, ball valve can be designed for structural fire protection. Compliance to API607, and JB/T6899 standard. In fire condition, after non-metal seal material burn out, metal seal pushed by pre-loaded spring to seal valve protect valve from leakage and fire.

PRESSURE RELIEF IN THE MIDDLE CHAMBER OF VALVE BODY

- When the stagnated medium in valve pressure valve rise over pre-stressed spring, seat will leave from the ball, it will automatically relief pressure, does not affect the upstream seat seal on the medium

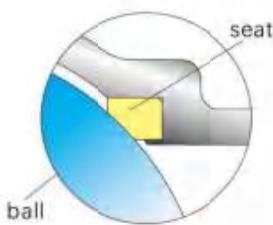

FLOATING BALL VALVE FEATURES

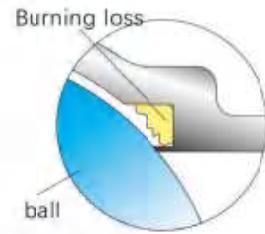

VALVE SEAT FIREPROOF DESIGN

► R-51300 floating ball valve seat tightly contact with ball in normal rotation service, when fire situation burn out of seal ring, flow medium push ball contact with metal seat form a metal-to-metal seal prevent from leakage.

● In normal use

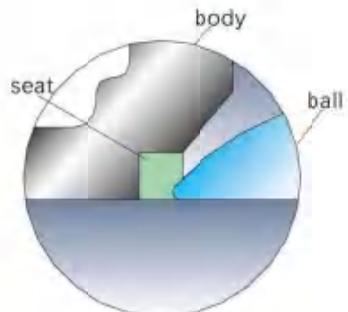

● After the fire

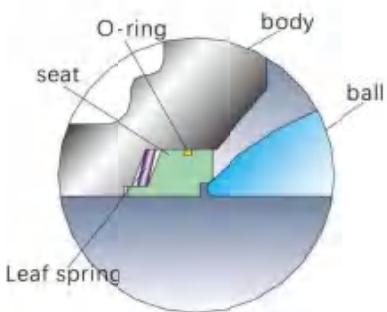

VALVE SEAT DESIGN

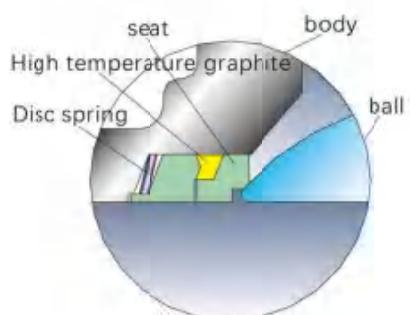

► Valve seat use PTFE which provide small friction, operation torque, and high chemical stability, applicable to most erosive medium. When valve in close position, through hole vertical to valve tunnel, medium tightly push ball into exist side seat, ensure fully sealing.

► Sealing surface overlay welding hard Co Cr alloy improve abrasion performance, when pass through small flow stream, flow pressure and Seat loaded pressure double secure tight contact between ball and seat. When flow pressure increasing, contact surface enlarge relatively to form a reliable sealing. Seat edge contain O-ring, this packing applicable to normal temperature with dirt medium.

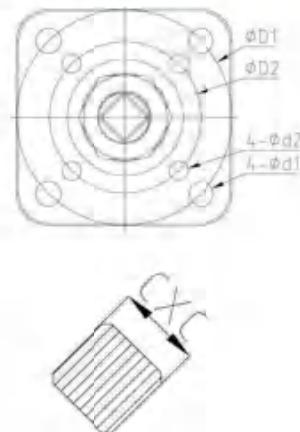

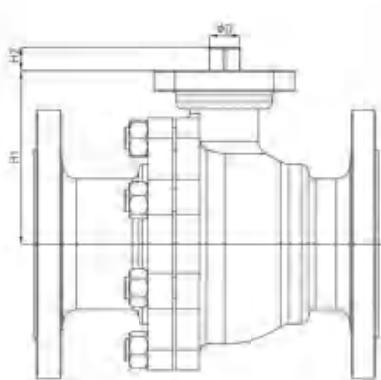

► Ball and seat made of metal materials, sealing surfacing overlay welding hard Co Cr alloy, corrosion resistance, good sealing performance. Seal edge covered by high temperature Graphite , while using a spring loaded seat structure, since the elastic restoring force of the spring pushing the seat, creat long-term sealing performance between the ball and seat. the seat can automatically corrected to achieve the best fit with the core of the ball. This seat can be used for high temperature and pressure medium occasions.

R51400

PRODUCT MANUFACTURING SPECIFICATION

Caliber range: 1" - 24" DN25-DN600
Pressure range: ANSI 150-900 # PN10-160
Connection type: flange type

PRODUCT FEATURES

- ▶ R-51400 rail ball valve uses the cam principle to make the ball valve break away from the sealing surface of the valve seat during rotation, and then push the ball to the valve seat to achieve sealing after rotation in place. Its main features are as follows:
- ▶ The function of opening and closing is frictionless, which completely solves the problem that the traditional valve seals are affected by the friction between sealing surfaces.
- ▶ Top mounted structure, the valve installed on the pipeline can be directly inspected and maintained online. It can effectively reduce device shutdown and production cost.
- ▶ The single valve seat design eliminates the problem that the medium in the valve cavity affects the use safety due to abnormal pressure rise.
- ▶ The valve rod with low torque design and special structure design can be opened and closed easily with a small handwheel valve. Wedge sealing structure: the valve is sealed by pressing the ball wedge onto the valve seat with the mechanical force provided by the valve stem, so that the sealing performance of the valve is not affected by the change of pipeline differential pressure, and the sealing performance is reliably guaranteed under various working conditions.

- ▶ Self cleaning structure of the sealing surface, when the ball is tilted away from the valve seat, the fluid in the pipeline will pass through the sealing surface of the ball in a 360 ° uniform manner. It not only eliminates the local scouring of the valve seat by high-speed fluid, but also washes away the deposits on the sealing surface, so as to achieve the purpose of self-cleaning.

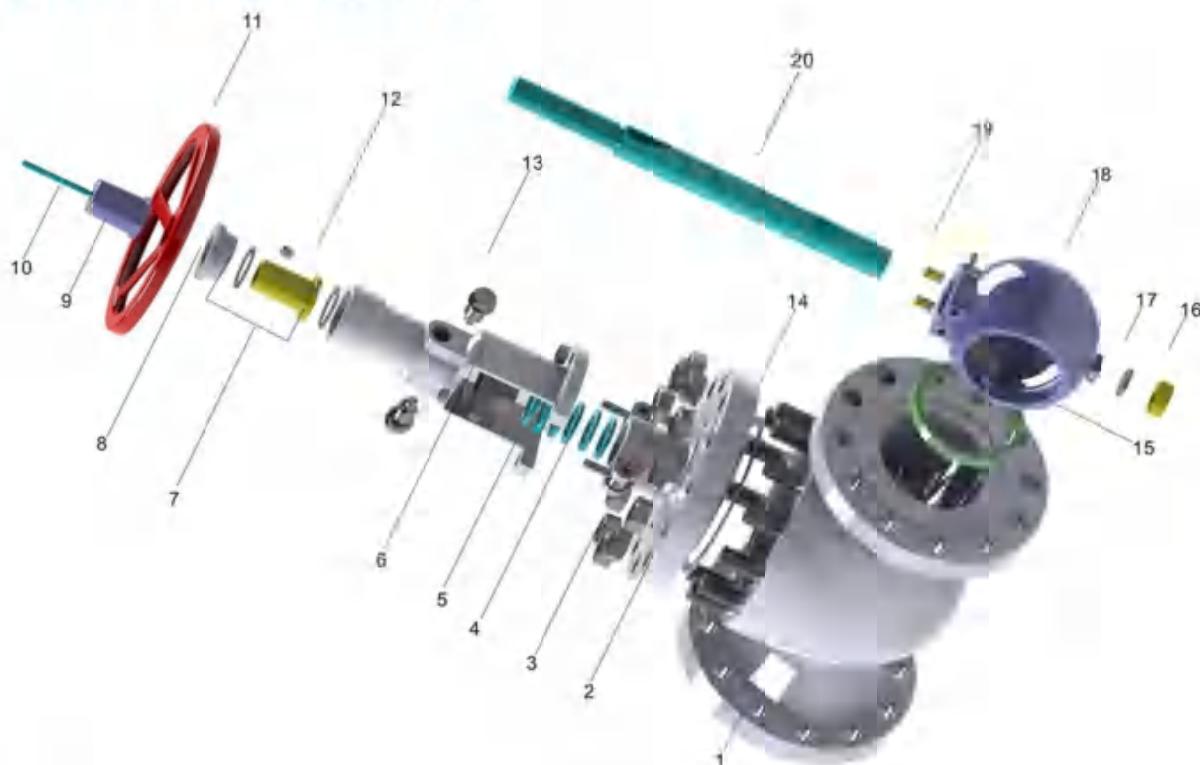

PARAMETER DESCRIPTION

- ▶ Valve body type: straight through
- ▶ Upper bonnet type: standard integrated temperature range: -196-538 °C
- ▶ Valve rod sealing form: PTFE self sealing structure sulfur free flexible graphite structure
- ▶ Connection mode: flange type
- ▶ Standard leakage class: ASME B16.104-197 CLASS V

PRODUCT APPLICATION

- ▶ Petroleum Smelting and Chemical Plant
- ▶ Metal smelting and pharmaceutical plants
- ▶ Mechanical paper making and power plant
- ▶ In natural gas long-distance pipeline
- ▶ In compressor system

BALL VALVE-GYR51400 SERIES

Control Valve(Zhejiang) Co.,ltd

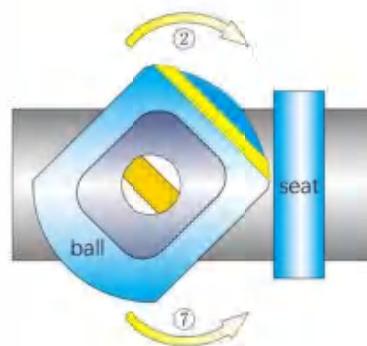

① When the valve is in the fully open position, turn the handwheel clockwise. With the valve stem nut and thrust bearing matched, the valve stem starts to drop and drives the ball to rotate.

⑧ Continue to turn the handwheel. When the valve stem rises to the limit position, the ball has also reversed 90° with the valve stem. The valve is in the fully open position.

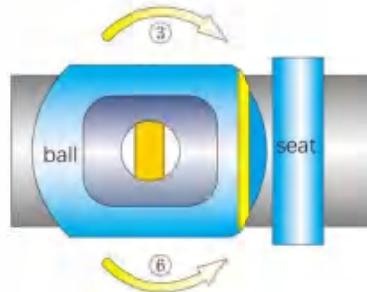

② Continuously rotate the handwheel, and the precise spiral curve groove track on the valve stem interacts with the guide pin embedded in it to drive the ball to rotate clockwise with the valve stem.

⑦ When the valve is about to open, the precise spiral curve groove track on the valve stem interacts with the guide pin embedded in it to drive the ball to rotate counterclockwise without friction with the sealing surface of the valve seat.

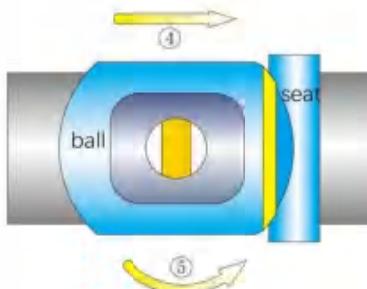

③ When the valve is about to close, the valve rod drives the ball to rotate 90° without friction with the sealing surface of the valve seat.

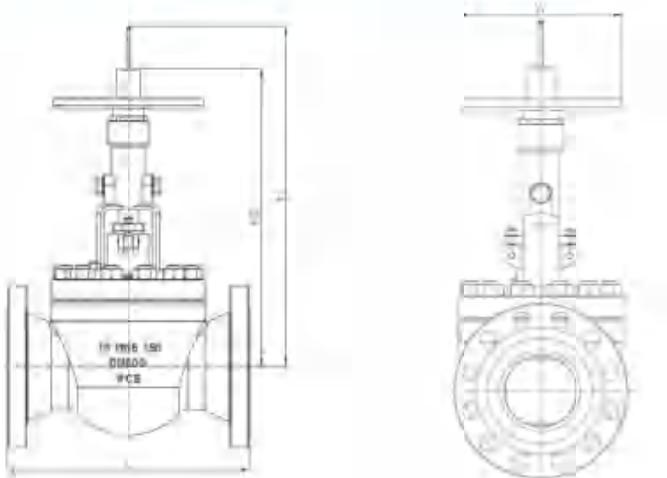

⑥ Continuously rotating the handwheel and valve rod will drive the ball to tilt away from the valve seat while rising.

④ Continue to rotate the handwheel, and the valve rod that descends again will press the ball mechanically, making the ball contact with the valve seat closely, so as to achieve the sealing effect.

⑤ Turn the handwheel counterclockwise when the valve is in the fully closed position. With the matching of the valve stem nut and the thrust bearing, the valve stem starts to rise and drives the ball to rotate
